

Smart Testing Workshop

24/09/2020 | CHIM Didier

Smart Testing Workshop Agenda

1. Key Objective
2. CCTU Scoring System
3. Bid Scoring System
4. Selection of CCTU and bid to be tested based on Score
5. Test Regimes
6. Implementation of Smart Testing

General context of Smart Testing

Key Objective and Scoring System

- The **key objective** of the Smart Testing is, for **given level of reliability**, to **reduce the number of availability tests**. This reduction should lead to lower capacity reservation costs and therefore savings in procurement costs of balancing services.
- Smart Testing aims to use **more extensively the available data** in order to increase the effectiveness of availability tests
- The principles of Smart Testing should be **applicable for all balancing products**.
- The proposed methodology suggests to implement **two scoring systems**:

| | | CCTU Scoring System | | | | | | |
|--------------------|-------|---------------------|--------|--------|--------|--------|--------|--------|
| | | D Day | CCTU 1 | CCTU 2 | CCTU 3 | CCTU 4 | CCTU 5 | CCTU 6 |
| Bid Scoring System | Bid 1 | | | | | | | |
| | Bid 2 | | | ★ test | | | | |
| | Bid 3 | | | | | | | |
| | Bid 4 | | | | | | | |

CCTU Scoring System

CCTU Scoring System determines which CCTU to select for an availability test

The Score per CCTU is based on 3 features:

- **Activation control:** past activations
- **Availability test:** past tests
- **Margin Analysis:** ex-post monitoring of contracted capacity

Weight to be fine-tuned

| Features | Weight | CCTU 1 | CCTU 2 | CCTU 3 | CCTU 4 | CCTU 5 | CCTU 6 |
|----------------------|--------|--------|--------|--------|--------|--------|--------|
| Activation Control | 33% | 39 | 12 | 34 | 29 | 74 | 73 |
| Availability test | 33% | 89 | 86 | 50 | 2 | 12 | 79 |
| Margin Analysis | 33% | 30 | 18 | 9 | 82 | 58 | 50 |
| Final Score per CCTU | | 52 | 39 | 31 | 38 | 48 | 67 |

The Score per CCTU ranges from 0 to 100.

- A low value indicates that the CCTU needs to be tested.

Activation control score in CCTU Scoring System

$$Score_{Activation}(CCTU) = \sum_M \underbrace{Score_{refActivation}(CCTU, M)}_{\text{Initial scoring based on magnitude of activations}} * \underbrace{F_{failure}(CCTU, M)}_{\text{Accounts for failures in activation controls}} * \underbrace{F_{freshness}(CCTU, M)}_{\text{Weighting of newer data}}$$

| Activation control Score | (A) | (B) | (C) | (A)*100 | (1-(B)) * (1-(C)) | | | |
|------------------------------------|--|---|---|---------------|-------------------|-------------|-------------|--|
| Month | Maximum Requested Volume (%) compared to average obligation of the month | Maximum Volume of Failed Activation (%) compared to obligation of the month | 'Percentage of time of failure compared to total time of activation request | Initial Score | Failure Factor | F freshness | Final Score | |
| M-2 | 46% | 9% | 10% | 46 | 82% | 4 | 5 | |
| M-3 | 80% | 2% | 5% | 80 | 93% | 4 | 10 | |
| M-4 | 49% | 10% | 10% | 49 | 81% | 4 | 5 | |
| M-5 | 86% | 2% | 5% | 86 | 93% | 3 | 8 | |
| M-6 | 6% | 4% | 4% | 6 | 92% | 3 | 1 | |
| M-7 | 44% | 0% | 0% | 44 | 100% | 3 | 4 | |
| M-8 | 38% | 2% | 9% | 38 | 89% | 2 | 2 | |
| M-9 | 10% | 1% | 7% | 10 | 92% | 2 | 1 | |
| M-10 | 22% | 1% | 8% | 22 | 91% | 2 | 1 | |
| M-11 | 54% | 0% | 0% | 54 | 100% | 1 | 2 | |
| M-12 | 34% | 3% | 3% | 34 | 94% | 1 | 1 | |
| M-13 | 70% | 0% | 0% | 70 | 100% | 1 | 2 | |
| Total CCTU Activation Score | | | | | | | 43 | |

Availability test score in CCTU Scoring System

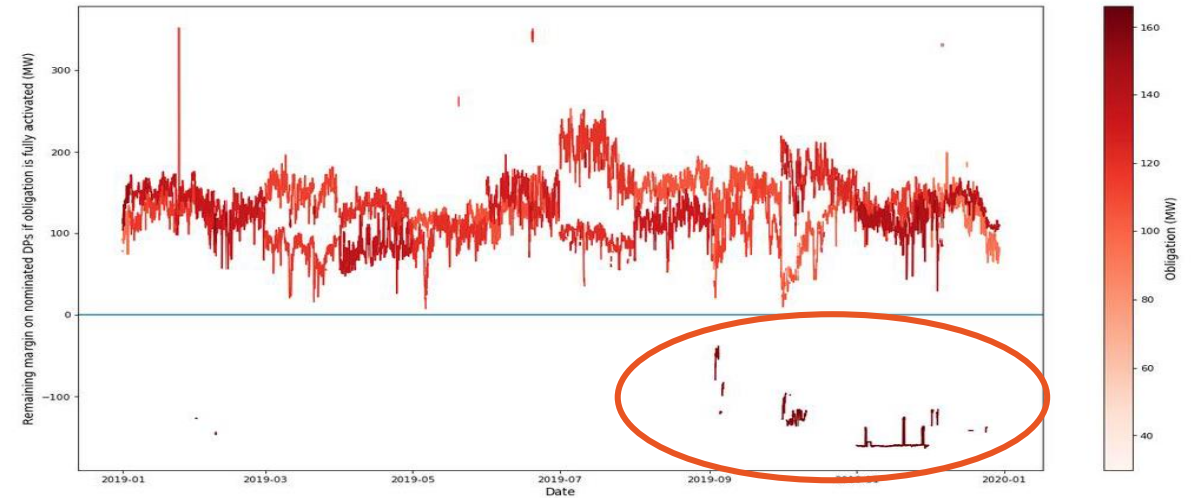

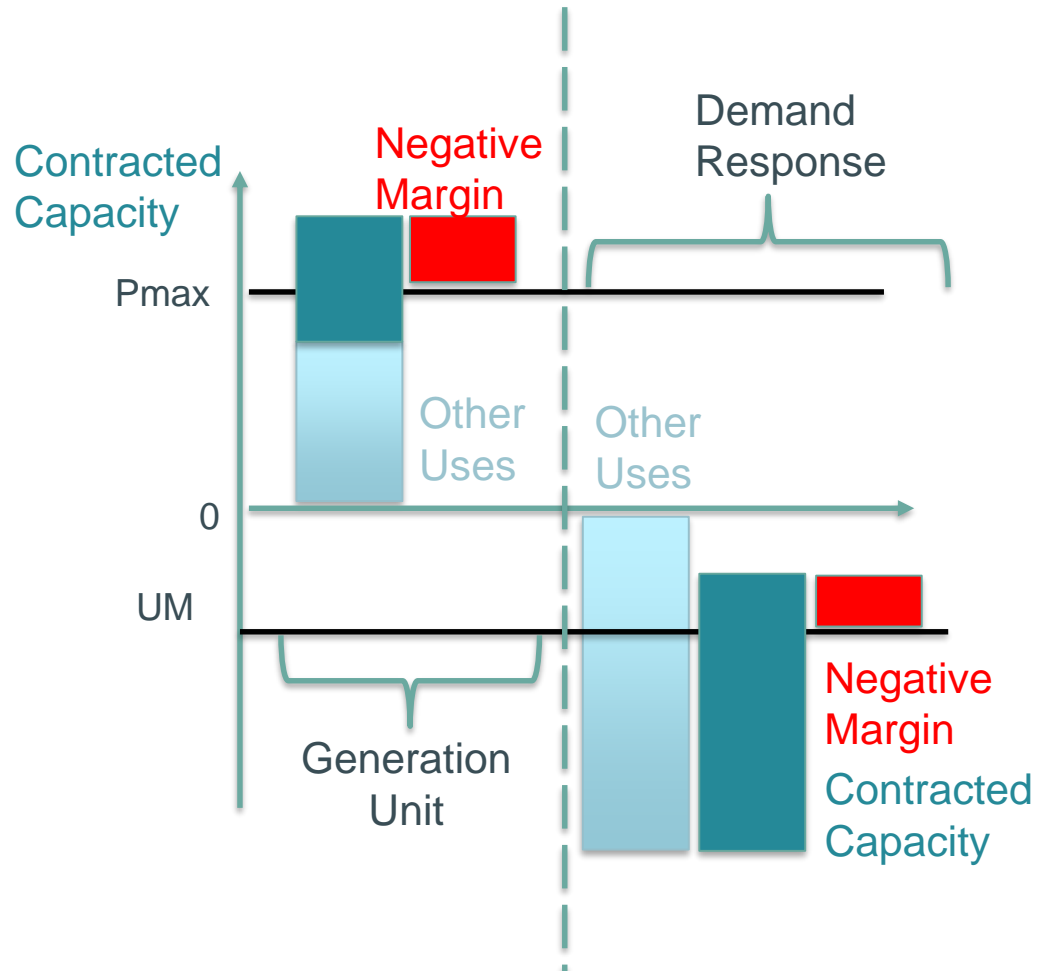

- If a test failed = 0 for a failed test
- If no test was performed = 50
- If all test were successful = 100

$$Score_{Availability}(CCTU) = \sum_M \underbrace{Score_{refAvailability}(CCTU, M)}_{\text{Initial Score}} * \underbrace{F_{freshness}(M)}_{\text{Weighting of newer data}}$$

| Availability | Percentage of successful availability tests for a given month | Number of test | Number of succesful test | Fail = 0, No test = 50; Success = 100 | Initial Score | F freshness | Final Score |
|--------------------------------------|---|----------------|--------------------------|---------------------------------------|---------------|-------------|-------------|
| M-2 | 0% | 1 | 0 | | 0 | 4 | 0 |
| M-3 | No Test Performed | 0 | 0 | | 50 | 4 | 7 |
| M-4 | 100% | 1 | 1 | | 100 | 4 | 13 |
| M-5 | No Test Performed | 0 | 0 | | 50 | 3 | 5 |
| M-6 | No Test Performed | | 0 | | 50 | 3 | 5 |
| M-7 | No Test Performed | 0 | 0 | | 50 | 3 | 5 |
| M-8 | No Test Performed | 0 | 0 | | 50 | 2 | 3 |
| M-9 | No Test Performed | 0 | 0 | | 50 | 2 | 3 |
| M-10 | 100% | 1 | 1 | | 100 | 2 | 7 |
| M-11 | 100% | 1 | 1 | | 100 | 1 | 3 |
| M-12 | 100% | 1 | 1 | | 100 | 1 | 3 |
| M-13 | No Test Performed | 0 | 0 | | 50 | 1 | 2 |
| Total CCTU Availability Score | | | | | | | 57 |

Margin analysis

The margin analysis is an ex-post monitoring of the availability of contracted capacity of the BSP.

- For a **demand response**, the **unscheddable margin (UM)** is used instead of the Pmax.
- The unscheddable margin is **approximated by the lowest off-take** value recorded for analysed time period

Margin score in CCTU Scoring System

$$Score_{margin}(CCTU) = \sum_M \sum_{D \in M} \frac{Score_{refMargin}(CCTU, D)}{100 * D} * F_{freshness}(M)$$

Initial score for each day, D
of the month, M
Weighting of newer data

$$Score_{refMargin}(CCTU, D) = \begin{cases} 100, & \text{if } margin \geq 0 \\ 100 - \frac{\text{non-compliant bid volume}}{\text{obligation for CCTU}}, & \text{else} \end{cases}$$

The % in volume of the non-compliant bid is removed from the score

| Month | Average volume (%) compared to average awarded capacity of the month | Initial Score | F freshness | Final Score |
|--------------------------------|--|---------------|-------------|-------------|
| M-2 | 84% | 84 | 4 | 11 |
| M-3 | 88% | 88 | 4 | 12 |
| M-4 | 81% | 81 | 4 | 11 |
| M-5 | 82% | 82 | 3 | 8 |
| M-6 | 99% | 99 | 3 | 10 |
| M-7 | 99% | 99 | 3 | 10 |
| M-8 | 100% | 100 | 2 | 7 |
| M-9 | 95% | 95 | 2 | 6 |
| M-10 | 90% | 90 | 2 | 6 |
| M-11 | 100% | 100 | 1 | 3 |
| M-12 | 81% | 81 | 1 | 3 |
| M-13 | 97% | 97 | 1 | 3 |
| Total CCTU Margin Score | | | | 90 |

| | CCTU 1 | CCTU 2 | CCTU 3 | CCTU 4 | CCTU 5 | CCTU 6 |
|-------|--------|--------|--------|--------|--------|--------|
| Day 1 | 100 | 100 | 100 | 70 | 100 | 90 |
| Day 2 | 100 | 60 | 100 | 100 | 50 | 100 |
| Day 3 | 100 | 100 | 40 | 100 | 100 | 100 |
| Day 4 | ... | ... | ... | ... | ... | ... |

Bid Scoring System

Bid Scoring System determines which bid to select for an availability test

The Score per CCTU is based on 3 features:

- **Activation control:** past activations
- **Availability test:** past test
- **Margin Analysis:** ex-post monitoring of contracted capacity

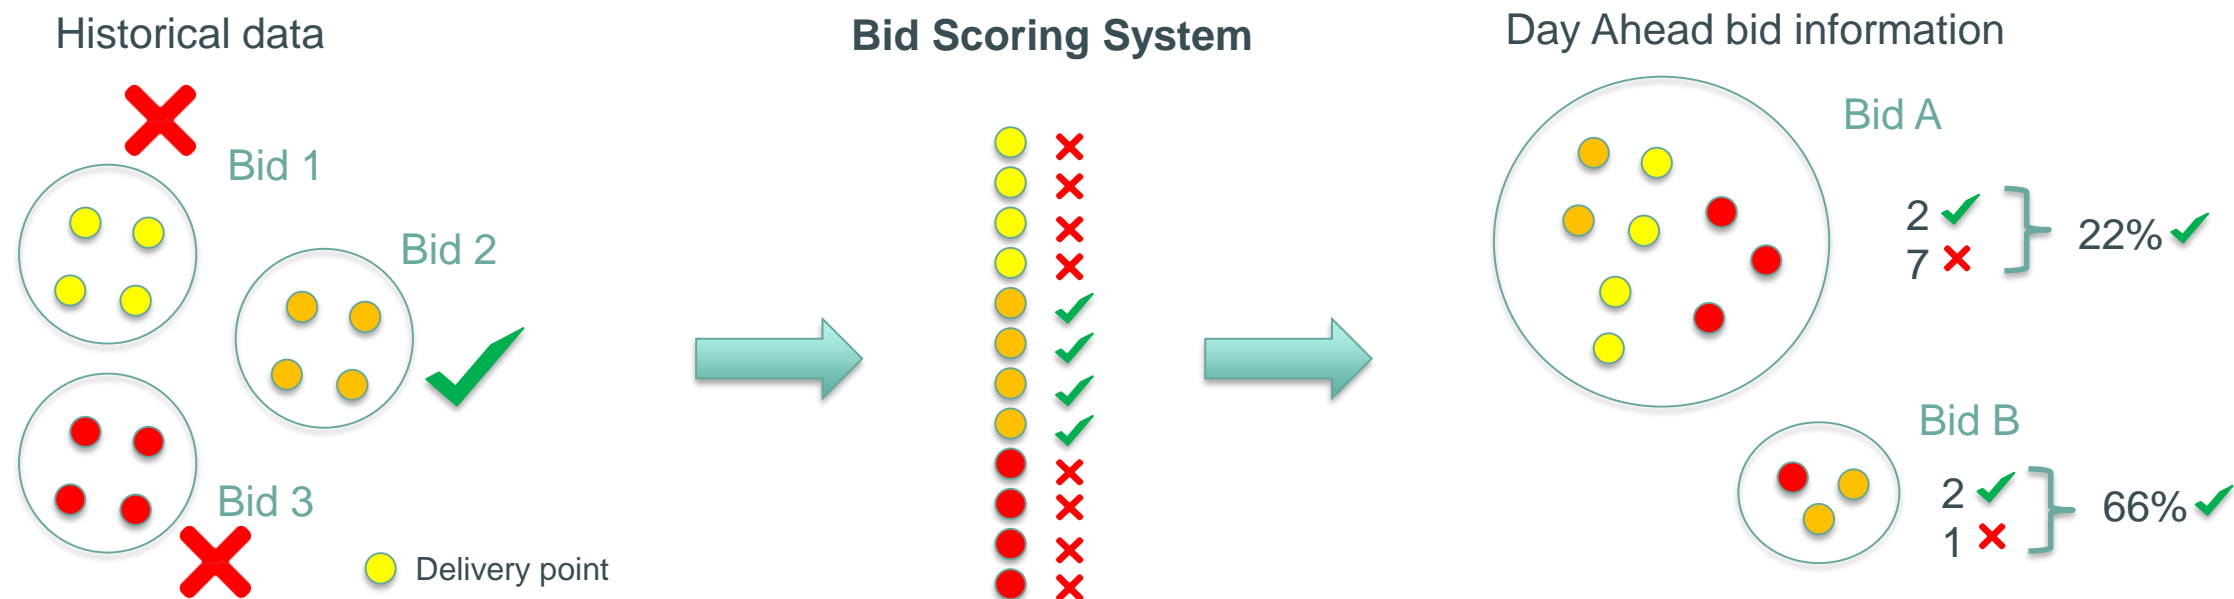

Weight to be fine-tuned

| Features | Weight | Bid 1 | Bid 2 | Bid 3 |
|--------------------|--------|-------|-------|-------|
| Volume | | 60 MW | 30 MW | 10 MW |
| Activation Control | 33% | 39 | 12 | 34 |
| Availability test | 33% | 89 | 86 | 50 |
| Margin Analysis | 33% | 30 | 18 | 9 |
| Final Score | | 52 | 39 | 31 |

- The Score per Bid is based on same 3 features but are adapted to the Bid Scoring System.

Bid Scoring System: Disaggregation of the results of activation control and availability test on a delivery point level

- Given that delivery points **can freely change** from one bid to another depending on the strategy of the BSP, **information on delivery point level** is necessary in order to have reliable data for the Bid Scoring System.
- Thus, the information of **activation control and availability test is disaggregated** from bid to delivery points level and then **re-aggregated** when the bids (and underlying DPs) are submitted by the BSP.

Activation control scoring for the Bid Scoring System

$$Score_{Activation}(bid) = \sum_M F_{freshness}(M) * Adjust(bid, M) * \left(\sum_{dp \in bid} Score_{refActivation}(dp, M) * F_{ratio}(dp, M) * Adjust(dp, M) \right)$$

Weighting of newer data

Initial scoring based on successful activations

Adjustment factor by DP size

Adjustment factor by bid size

Accounting for relative and absolute activation ratio

DP level analysis

| Month | Activation Control | (A) Percentage of successful activation control | (B) Activation Ratio (%) compared to total activation time | (C) Activation Ratio (%) compared to the month | 100* (A) | Initial Score |
|-------|--------------------|--|---|---|-------------|---------------|
| M-2 | DP1 | | 85% | 59% | 15% | 85 |
| M-2 | DP2 | | 80% | 58% | 69% | 80 |
| M-2 | DP3 | | 92% | 84% | 67% | 92 |
| M-2 | DP4 | | 93% | 72% | 86% | 93 |
| M-2 | DP5 | | 96% | 67% | 1% | 96 |
| M-2 | DP6 | | 88% | 93% | 66% | 88 |
| M-2 | DP7 | | 100% | 100% | 58% | 100 |
| M-2 | DP8 | | 89% | 96% | 5% | 89 |
| M-2 | DP9 | | 84% | 83% | 88% | 84 |
| M-2 | DP10 | | 91% | 60% | 70% | 91 |
| M-3 | | | | | | |

Bid level analysis

| | DP Size | (A)*100 Final Score | (B)*(C) Initial Score | (D) Bid Size Adjustment per bid | (E) Bid Size Adjustment per bid | (1-E)* Final Score |
|-------|---------|------------------------|--------------------------|------------------------------------|------------------------------------|-----------------------|
| Bid 1 | 85,0% | 6 | | | | |
| Bid 1 | 5,0% | 2 | | | | |
| Bid 1 | 5,0% | 3 | | | | |
| Bid 1 | 5,0% | 3 | 13 | | 60% | 5 |
| Bid 2 | 25,0% | 0 | | | | |
| Bid 2 | 25,0% | 14 | | | | |
| Bid 2 | 25,0% | 15 | | | | |
| Bid 2 | 25,0% | 1 | 29 | | 30% | 20 |
| Bid 3 | 54,5% | 33 | | | | |
| Bid 3 | 45,5% | 17 | 51 | | 10% | 45 |

Availability test scoring for the Bid Scoring System

- If a test failed = 0 for a failed test
- If no test was performed = 50
- If all tests were successful = 100

$$\text{Score}_{Availability}(bid) = \sum_M \overbrace{F_{freshness}(M) * \text{Adjust}(bid, M)}^{\text{Weighting of newer data}} * \left(\sum_{dp \in bid} \overbrace{\text{Score}_{refAvailability}(dp, M) * \text{Adjust}(dp, M)}^{\text{Adjustment factor by DP size}} \right)$$

Adjustment factor by bid size
Adjustment factor by DP size

DP level analysis

| Month | Availability test | Percentage of succesful availability test | Initial Score |
|-------|-------------------|---|---------------|
| M-2 | DP1 | 100% | 100 |
| M-2 | DP2 | 100% | 100 |
| M-2 | DP3 | 100% | 100 |
| M-2 | DP4 | 100% | 100 |
| M-2 | DP5 | 50% | 50 |
| M-2 | DP6 | 50% | 50 |
| M-2 | DP7 | 100% | 100 |
| M-2 | DP8 | 50% | 50 |
| M-2 | DP9 | 50% | 50 |
| M-2 | DP10 | 50% | 50 |
| M-3 | | | |

| | DP Size Adjustment | Final Score per DP | Initial Score per bid | Bid Size Adjustment per bid | Final Score |
|-------|--------------------|--------------------|-----------------------|-----------------------------|-------------|
| Bid 1 | 85,0% | 85 | | 60% | 40 |
| Bid 1 | 5,0% | 5 | | | |
| Bid 1 | 5,0% | 5 | | | |
| Bid 1 | 5,0% | 5 | 100 | | |
| Bid 2 | 25,0% | 13 | | 30% | 44 |
| Bid 2 | 25,0% | 13 | | | |
| Bid 2 | 25,0% | 25 | | | |
| Bid 2 | 25,0% | 13 | 63 | | |
| Bid 3 | 54,5% | 27 | | 10% | 45 |
| Bid 3 | 45,5% | 23 | 50 | | |

Bid level analysis

Margin Scoring for the Bid Scoring System

$$\text{Score}_{margin}(bid) = \sum_M \overbrace{F_{freshness}(M)}^{\text{Weighting of newer data}} * \underbrace{\text{Adjust}(bid, M)}_{\text{Adjustment factor by bid size}} * \left(\sum_{dp \in bid} \sum_{qh \in M} \overbrace{\frac{\text{Score}_{refmargin}(dp, qh)}{\# qh}}^{\text{average time of a DP is part of a bid with a positive margin}} * \underbrace{\text{Adjust}_{CB}(dp, M)}_{\text{Adjustment factor by DP size}} \right)$$

$$\text{Score}_{refmargin}(dp, qh) = \begin{cases} 100, & \text{if } bid \text{ margin} \geq 0 \\ 0, & \text{else} \end{cases}, \text{ only when a DP is effectively part of a bid and for non-activated bid}$$

DP level analysis

| | Margin | Average time (%) of a DP being part of a bid with positive margin | Initial Score |
|-----|--------|---|---------------|
| M-2 | DP1 | 74% | 74 |
| M-2 | DP2 | 10% | 10 |
| M-2 | DP3 | 54% | 54 |
| M-2 | DP4 | 38% | 38 |
| M-2 | DP5 | 42% | 42 |
| M-2 | DP6 | 96% | 96 |
| M-2 | DP7 | 38% | 38 |
| M-2 | DP8 | 3% | 3 |
| M-2 | DP9 | 58% | 58 |
| M-2 | DP10 | 50% | 50 |
| M-3 | | | |

| | DP Size Adjustment | Final Score per DP | Intial Score per bid | Bid Size Adjustment | Final Score per bid |
|-------|--------------------|--------------------|----------------------|---------------------|---------------------|
| Bid 1 | 85,0% | 63 | | | |
| Bid 1 | 5,0% | 1 | 44 | | |
| Bid 1 | 5,0% | 3 | | | |
| Bid 1 | 5,0% | 2 | | 60% | 17 |
| Bid 2 | 25,0% | 11 | | | |
| Bid 2 | 25,0% | 24 | 45 | | |
| Bid 2 | 25,0% | 10 | | 30% | 31 |
| Bid 2 | 25,0% | 1 | | | |
| Bid 3 | 54,5% | 32 | 27 | | |
| Bid 3 | 45,5% | 23 | | 10% | 24 |

Bid level analysis

Selection of CCTU and bid based on Score

Selection in Smart Testing

The actual selection of the CCTU and bid(s) remains confidential in order to keep the unpredictability aspects of the availability testing. Elia will keep a balance between an optimal selection of the CCTU and/or bid(s) and the randomness of the test. Moreover, further considerations including impact on operational processes need to be taken into account during an implementation phase.

Predictability

Selection of the worst score

| CCTU | 1 | 2 | 3 | 4 | 5 | 6 |
|---------------|------------|----|----|----|----|----|
| Score | 10 | 15 | 20 | 50 | 60 | 70 |
| Selection (%) | 100 | 0 | 0 | 0 | 0 | 0 |

Selection probability is function of the score

| CCTU | 1 | 2 | 3 | 4 | 5 | 6 |
|---------------|----|----|----|----|----|----|
| Score | 10 | 15 | 20 | 50 | 60 | 70 |
| Selection (%) | 24 | 23 | 21 | 13 | 11 | 8 |

Selection probability is equal for the 3 worst scores

| CCTU | 1 | 2 | 3 | 4 | 5 | 6 |
|---------------|----|----|----|----|----|----|
| Score | 10 | 15 | 20 | 50 | 60 | 70 |
| Selection (%) | 33 | 33 | 33 | 0 | 0 | 0 |

Test regimes

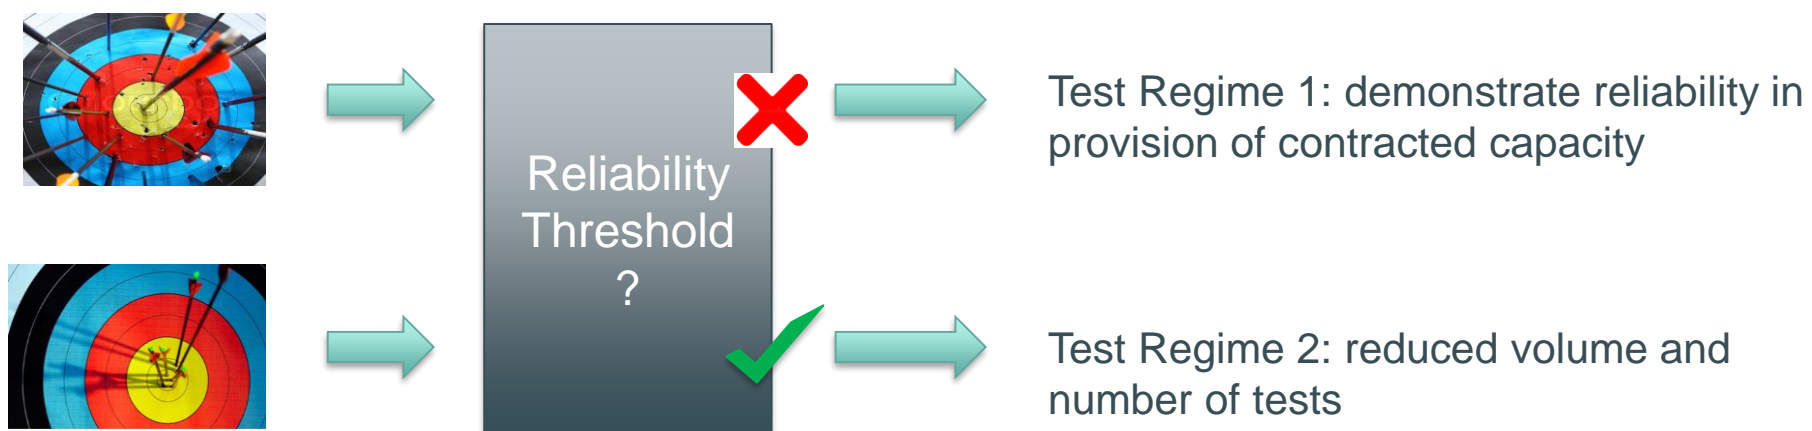

This is what the potential subhead looks like

Test regimes: approach to reduce volume of test

Additionally to the scoring system, **two test regimes** are introduced to limit the impact in volume and number of availability tests.

1. The first test regime **aims to ensure** that a significant part of **the contracted capacities** from a BSP is **compliant**.
2. The second test regime aims **to keep in check the compliancy** of a BSP but with a **lower volume and number of availability tests**

Threshold for the second test regime

- The threshold is the **average of the obligations** from the last 12 months, adjusted by the freshness of the data.

$$\text{Threshold} = \sum_M \overbrace{F_{\text{freshness}}(M)}^{\text{Weighting of newer data}} * \underbrace{\text{Average}_M}_{\text{Average Obligation for the month M}} \left[\overbrace{\text{Max}_D}_{\text{Maximum Obligation per day D}} (\text{Obligation}(\text{CCTU}, D)) \right]$$

- In the **second test regime**, a **maximum of 4 successful tests** can be performed on a rolling 12 months basis. For each availability test (in the second regime), the tested volume is **capped to 50%** of the contracted volume of the day.
- A **BSP which performs well** has its **volume and number of tests reduced** compared to the current design.

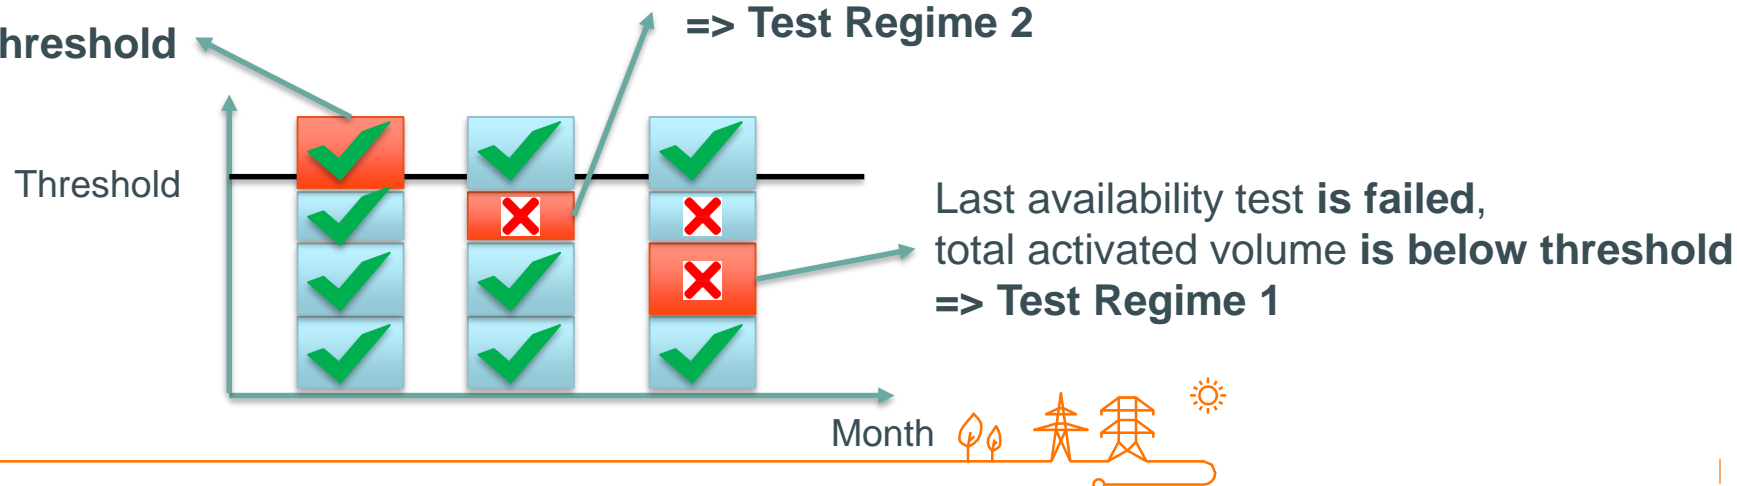

Conditions of validity for Second Test Regime

- In order for a BSP to be in the second test regime, the BSP needs to have an **cumulative activated volume** of each delivery point (via activation control or availability test) **above the threshold** in the last 12 months (M-2 to M-13).
- The **activated volume** of a delivery point **is considered as valid** if it was part of an bid which was successfully activated during the last activation control and/or availability test.
- If a delivery point (and associated volume) **is not valid anymore**, then the BSP may fall below the threshold and **go back to test regime 1**.

Last activation is **successful**,
total activated volume **above threshold**
=> **Test Regime 2**

Last activation control **is failed**,
total activated volume **remains above threshold**
=> **Test Regime 2**

-  Activation control or availability test
-  New control or test

Implementation of Smart Testing

Decision on the implementation of Smart Testing

- The decision on the implementation of Smart Testing and the related planning will be discussed with the stakeholders during the next Working Group Balancing meetings.
- The goal of the approach is to provide to the stakeholder a forum where they can express their views on a global overview of the work plan for upcoming projects in the years to come and to agree on priorities.
- The implementation decision will be based on the feedback of the stakeholders, priorities and technical feasibility. The recommendation to implement or not and, provided a positive implementation decision, the implementation plan will be part of the final report.

Step-wise implementation of Smart Testing

If an implementation is decided, Elia proposes a **step-wise implementation of Smart Testing starting with mFRR**, for the following reasons:

- **REX** from implementation of one product should **increase the efficiency** of the development (adjusted by the complexity and specificity of the product to be implemented)
- The **mFRR product is ideal candidate** as a starting point given:
 - Limited amount of data to be handled compared to other products
 - Clear request from stakeholders for the mFRR product
- Additionally, Terms and Conditions for BSP of all balancing products would require to be amended at the same time (including public consultations, consultation report and approval).
